# 1. Renewable Energies

SLIDE 3

Kilham East Yorkshire

Most renewable energy is derived from the sun<sub>7</sub>:

1. **Solar Energy** electricity directly from sunlight or by heating
2. **Biofuels** *via* photosynthesis and burning of plants
3. **Hydroelectric** *via* the hydrological cycle
4. **Wind** *via* pressure systems
5. **Wave** *via* wind (and hence pressure systems)
6. **Tidal** tides driven by lunar and solar gravity \*
7. **Geothermal** Planetary cooling for thermal energy \*

\* not derived from the sun

next

## 2. A Brief History of Tidal Science

SLIDE 4

From *The Analysis of Tidal Stream Power*, Wiley, 2009  
by J.Hardisty

1. Aristototle (384-322 BC) '*ebbings and risings of the sea always come round with the Moon*'
2. Ptolemy (90-168 AD) Earth centred Solar System
3. Kepler (1571-1630) Laws and '*sphere of influence of the Moon*'
4. Galileo (1564-1642) used telescopes to prove the helio-centric Solar System
5. Isaac Newton (1643-1727) introduced  $F=ma$  and used gravity to prove his equilibrium theory of tides
6. Laplace (1749-1827) derived the dynamic theory of tides and introduced harmonics
7. Lord Kelvin (1824-1907) Developed full harmonic analyses and quantified the tidal species  $S_2$ ,  $M_2$ ,  $M_4$  etc..
8. Arthur Doodson (1890-1968) tide prediction machines

next

# 3. Tidal Elevations

SLIDE 5

1. The Earth is a sphere surrounded by a film of water
2. The Moon (66% and the Sun 33%) exert gravitational attraction on the water
3. The gravitational attraction generates two bulges
4. The earth spins beneath the bulges giving High Waters and Low Waters
5. The tides also generate ebb and flood flows

next

## 4. Power from Tidal Elevations : Barrages

SLIDE 6

**Potential Energy** of trapped water is:

$$P_E = mgh = \rho W R L g R/2$$

Where  $P_E$  energy liberated per semi-cycle

Thus mean Tidal Power:

$$P_T = e P_E / (T/2)$$

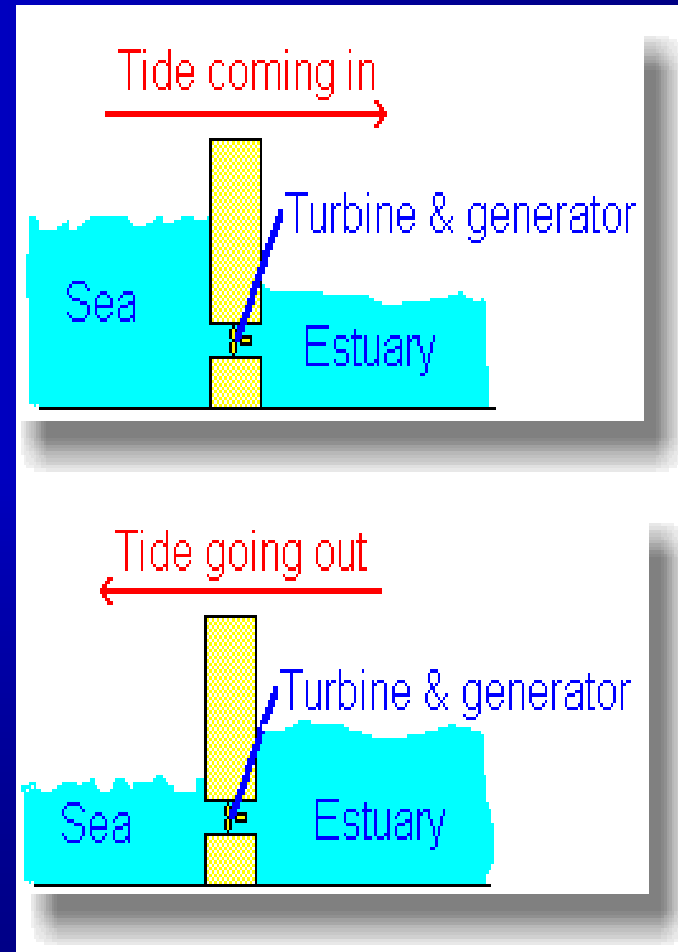

Where  $e$  is the efficiency  
 $T$  is the tidal period

For a barrage across the Humber:

$$R = 6, W = 5,000, L = 40,000, e = 0.75, T = 6.2 \times 60 \times 60$$

$$\begin{aligned} \text{Thus } P_E &= 35,300 \text{ GJ} \\ P_T &= 2,300 \text{ MW (2.3 GW)} \\ &\text{about 4 nuclear power stations} \end{aligned}$$

## 6. Tidal Currents

SLIDE 8

<http://tidesandcurrents.noaa.gov/nyports/nyports.shtml?port=ny>

Harmonic analysis gives the tidal current speed:

$$U = (R/2)\sqrt{g/h} \cos(2\pi t/T)$$

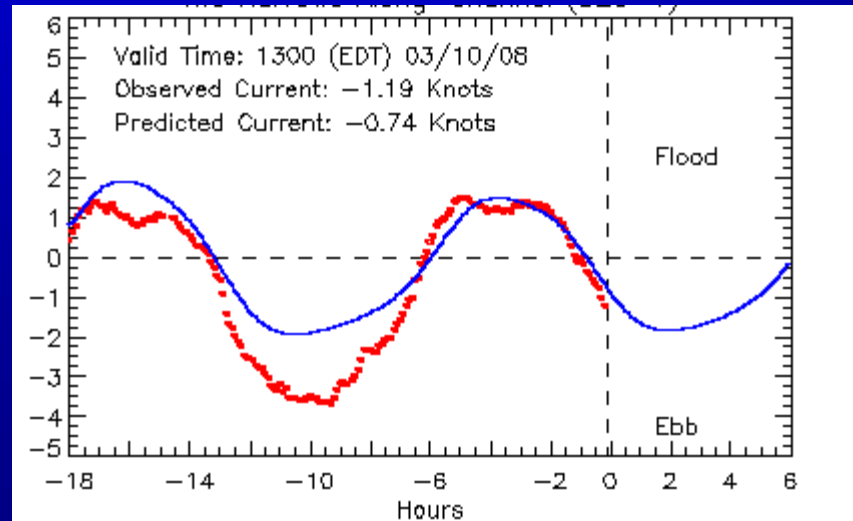

Where  $U$  is the current speed at time  $t$  (m/s)

$R$  is the tidal range (m)

$h$  is the water depth (m)

$T$  is the tidal period (semi-diurnal = 12.4 hrs) hrs

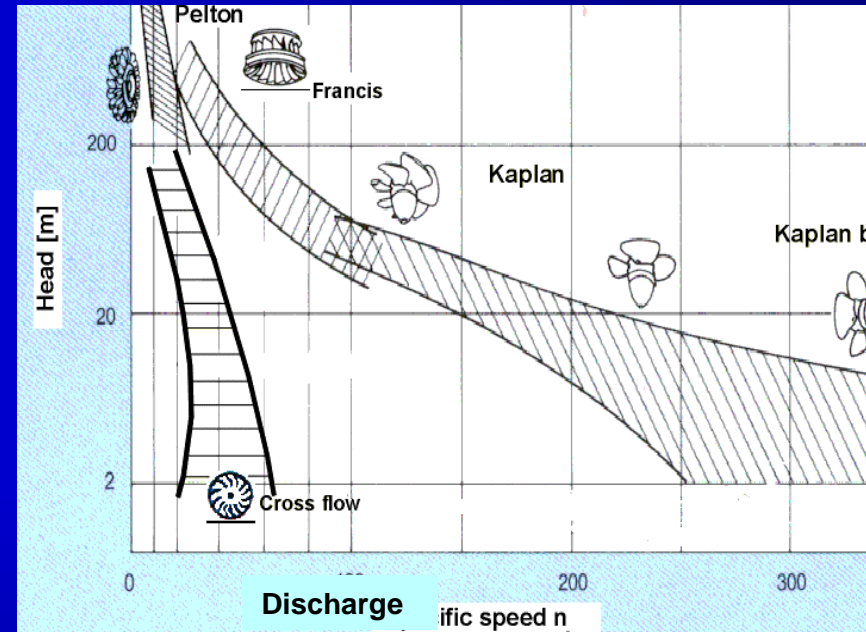

The result is a sinusoid varying from low water slack, through flood, high water slack and ebb

# 7. Power from Tidal Currents : Turbines

SLIDE 9

## Four hydroelectric turbine technologies:

1. Pelton Very large head 500-2,000 m
2. Francis Large head 200-500 m
3. Kaplan Head 10-200 m
4. Crossflow Small head 1-20 m

next

# 7. Power from Tidal Currents : Turbines

SLIDE 10

The power in the tide is the kinetic energy of the water mass passing through the blades each second:

$$P = \frac{1}{2} m V^2$$

Horizontal axis  $P \sim 1500 V^3 R^2$

Vertical axis  $P \sim 500 V^3 h w$

Typically for 50% efficiency:

$$P_E = 750 V^3 R^2 \text{ (horizontal)} = 500 V^3 h w \text{ (vertical)}$$

Thus

10 m horizontal axis in  $2 \text{ ms}^{-1} = 150 \text{ kW}$

20m vertical axis in  $3 \text{ ms}^{-1} = 2.7 \text{ MW}$

## 9. The Neptune Hull Roads Project

SLIDE 14

- i. 20.0 LOA x 14.0 beam x 6.50 OD, floating Balmorel buoyancy device with low cost exo-skeletal framework
- ii. Moored in estuarine locations to minimise structural, maintenance, cabling and O&M costs
- iii. Vertical axis crossflow rotor significantly reduces capital and O&M costs as all electrical systems are above water
- iv. Turbine drives 2 x David Brown G19 gearboxes into 2 x Brook Crompton DC Generators and 2 x Sprint Thyristor drives producing 3 ph 450 V, mains synchronised output up to 500kW

## 9. The Neptune Hull Roads Project

SLIDE 15

1. Demonstrator under construction at MMS Shiprepairs, Alexandra Dock, Hull
2. Launch January 2009 to supply KHCC
3. 'Iconic' location off The Deep in support of KHCC regeneration objectives of Healthcare, Port Logistics and Renewable Energy
4. Humber I array (10-15,000 MWh/yr) completed March 2010
5. Humber II (January 2011) then Mersey I and II by November 2011 and September 2012
